Weather Assistant

Hover for Help!

This is the weather assistant you always wish you had! Type in a weather-related question, make sure to include a location, and the assistant will do its best to answer and advise you.

It uses OpenAI to parse the input data, then hits two separate APIs. The first is to turn location "names" into latitude and longitude coordinates (**OpenCage Geocoder**), and the second is to get the weather data (**OpenWeatherMap**). The reported JSON data is then interpreted by the LLM and reported back in a friendly and helpful manner.

What's the weather in Boston?

Submit

Response:

Currently in Boston, the temperature is 13.5 degrees Celsius, but it feels slightly colder at 13.12 degrees. The sky is mostly clear with a few clouds (20% cloud cover). The humidity is relatively high at 85%. The wind is coming from the East at a speed of 1.54 m/s. There is no precipitation occurring at this moment. As a reminder, even though it seems mild, you may want to wear a light jacket as it feels slightly chillier than the actual temperature and the humidity will make it feel cooler too.
